

GUIDE TUBE RANGE

Australian Clutch Services list a comprehensive range of guide tubes. Guide tubes are becoming increasingly popular in European applications including Alfa Romeo, Fiat, Renault, Citroen and Peugeot vehicles.

The guide tube (also commonly referred to as a nose cone) allows movement of the thrust bearing and often plays the important role of sealing the input shaft and gearbox to stop gearbox oil leaking into the bellhousing.

Inspection of guide tubes for wear & operation is recommended when installing new clutch kits

For specific applications, please contact ACS or your nearest distributor. For further information and to see the complete range of listings, please visit the Australian Clutch Services catalogue at www.australianclutch.com.au
